

Task 11

date: 14/10/25

Cypher Operations In graph database

Aim: - To perform Cypher operations like creating, inserting, querying, finding deleting operations on graph spaces.

Create node with properties

Properties are the key value pairs along which a node stores data. You can create a node with properties using create clause.

Syntax:

Create (node label, key1; value1, key2, value2, ...)

* Returning the created node, do verify the creation of the type of execute the following queries on

* Creating relationships

We can create a relationship using the create clause well in relationships with to square brackets [].

Syntax:

Create (node1; (relationship type -> (node2))

* Creating a relationship b/w the nodes you can also create a relationship using the create clause.

Syntax:

WATCH (a: label of node 1), b;

(label of node 2) where 'a, name'

"name of node 1" AND "name"

name of node create (a) - (relationship) -> (b)

return a, b

→ deleting a particular node to delete a particular node you declined from,

graph & node : label & properties...

netusch delete node

create a graph, database for mobile
phone converter

Can tel (n:middle lsid, phone -id 24862";

name: "realme"

Brand: "oppo"

Output:

Added: label, created / node; set 3 properties

Completed after 232ms

create d (n: mobile & realme; "26478")

brand name: "oppo"

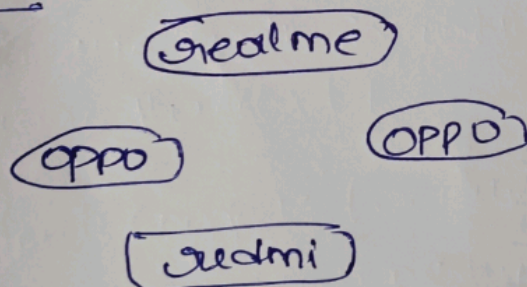

Output:

Added "label, created / node; set 3

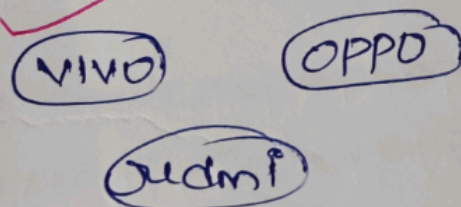

properties; completed after 16ms

create (n: mobile [realme: "2465", 4])

Output:

match (n: mobile, return (n))

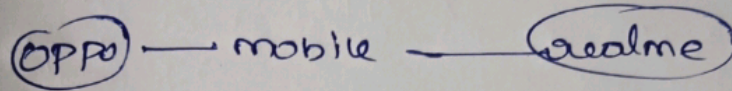

2. Create relationships between mobile and brand oppo.

match(m, mobile)(create, where, m.name =

"realme" AND B brand name = "oppo"

create(m, (m: mobile -> A) -> [d])

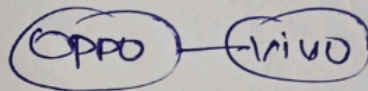

Output

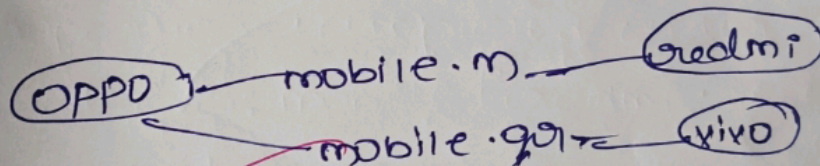

create(m) - (m - mobile - m) -> [d]

return;

Output;

match(n) return(n)
